                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Assembled from pUC19 and M13mp9 by F. Pfeiffer, MPI, Martinsried Revised 16-DEC-1986 by F. Pfeiffer:
2287/8 'AT' to 'TA' to match revised sequence of PBR322
The strand shown contains the beta-galactosidase mRNA sequence including the multiple cloning site of M13mp9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     #offspring
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            #parent

                                                                                                                                                                                                                       To produce greater versatility of insertional inactivation of beta-galactosidase activity for subcloning and sequencing, a chemically synthesized oligonucleotide, specifying nine restriction sites including BglII, XhoI, NruI, ClaI, SacI and EcorV in various configurations with existing polylinkers, was created. These improved polylinkers were inserted into plasmids for routine cloning of ds-DNA and into chimeric phage/plasmids for biological production of ss-DNA. The most versatile polyrecognition pattern specifies 17 restriction sites in the beta-galactosidase alpha-complementing gene fragment. Clone pIC7 was used to produce all the other polylinker-carrying vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Assembled from pUC8 and GenBank:pIC7 by F. Pfeiffer COMMENT For construction of pTC7, a synthetic oligonucleotide has been used to replace the pUC8 polylinker and thus to construct a new cloning vector with a different polylinker. The other pIC-vectors are based on this new pIC7 polylinker, which was combined with the existing pUC9 and pUC19 polylinkers in the

2296/7 'AT' to 'TA' to match revised sequence of PBR322
The strand shown contains the beta-galactosidase mRNA sequence including the multiple cloning site of M13mp7.

The present sequence is the commercially available plasmid pSP72. The CS SV40 polyadenylation sequence, the rat neuron specific enclase (NSE) promoter and the human cDNA for p25 were cloned into plasmid pSP72 to GC generate the NSE-p25 transgene. This was used in the production of CC cdx5. Overexpression of p25 is sufficient to produce hyperphosphorylation CC of tau, which is seen in the neurofibrillary tangles associated with CC Alzheimer's disease. The transgenic animals are useful as in vivo systems CC for screening potential therapeutic compounds for their ability to CC inhibit or prevent the production of hyperphosphorylated tau and CC associated neuronal death. The transgenic animals are suitable for use as disease models of neurodegenerative diseases and tau-related pathologies, CC such as Alzheimer's disease, parkinson's disease, amyelolateral CC sclerosis, Huntington's disease, stroke, traumatic brain injury, CC spinocerebellar degeneration. They are also useful as models of cdk5/p25 and tau biochemistry, and to establish the role of the human p25 in the formation of hyperphosphorylated tau in neurodegenerative conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches 1001;

                                 The present invention describes a peptide, its complex, derivative or its polymerizate, where the peptide (I) has a formula of: alpha1-alpha2-alpha3-alpha4-alpha5-alpha6-alpha7 where alpha1 to alpha7 = amino acid sequence selected from amino acid sequences ranging from 11-19 amino acids derived from T cell epitopes derived from cedar (japanese cedar - Cryptomeria japonica) pollen allergens. The peptide can be used in an antisugipollinosis agent. AAF59011 to AAF69062 and ABB69094 to AAB69121 represent sequences used

Transposon Tn7 encodes an ATP-utilising regulatory protein that contains a mutation that allows efficient and simple insertion of, and reduced target site specificity of, a transposable element derived from the transposon. The ATP-regulatory protein and compositions are us for the efficient, non-specific and simple insertion of a transposon or transposable element into a DNA segment. This is useful in DNA sequencing, for genetic analysis by insertional mutagenesis, or for alteration of gene expression by insertion of a desired sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Transposon(s) encoding mutant ATP using proteins for insertion which is efficient and random, with reduced site specificity; for DNA sequencing and altering gene expression

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC The present sequence represents the DNA sequence of the vector CC pGEM3-2f(-), used in the course of the invention. The specification CC describes a method for screening agents for activity against a microbial CC pathogen that has an intein (i.e. a protein-splicing element occurring CC naturally as an in-frame protein fusion) in a gene that encodes a protein CC that facilitates growth. The method comprises preparing recombinant CC clones of an inducible expression vector containing an altered reporter CC gene, including a silent restriction site, and the intein, and detecting CC the presence of the extein product of the intein by recombinant clones in CC tree containing concentrations of the agent. Reduced production of CC the extein product indicates inhibition of the intein, i.e. that the CC agent has antimicrobial activity. The agents of the invention represent CC intein and thus formation of an active, essential protein. The same CC intein and thus formation of an active, essential protein. The same CC intein function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
